## 2:      0.30
## 3:      0.45
## 4:      1.00
```

By combining the classic and extended versions of the maintainability index, our analysis reveals differences between Fortran and Python implementations. Using the weighted measure (M_{LOC}), 70% of Fortran code falls into the “low” maintainability category, compared with only 15% when using the unweighted average (M_{average}). This discrepancy indicates that a few complex, poorly maintainable routines dominate the overall profile of the Fortran codebase. In contrast, Python routines present a more favorable profile: 27% achieve high maintainability under M_{LOC} , and all are classified as “highly maintainable” under M_{average} .

```
# PLOT MAINTAINABILITY INDEX #####
```

```
