## 3:        0.45
## 4:        1.00
```

By combining the classic and extended versions of the maintainability index, our analysis reveals differences between Fortran and Python implementations. Using the weighted measure (M_{LOC}), 70% of Fortran code falls into the "low" maintainability category, compared with only 15% when using the unweighted average (M_{average}). This discrepancy indicates that a few complex, poorly maintainable routines dominate the overall profile of the Fortran codebase. In contrast, Python routines present a more favorable profile: 27% achieve high maintainability under M_{LOC}, and all are classified as "highly maintainable" under M_{average}.

```r
# PLOT MAINTAINABILITY INDEX ###############################################

plot_maintainability_index <- dt$maintainability_index %>%
  melt(., measure.vars = c("M_loc", "M_average")) %>%
  .[, variable:= factor(variable, levels = c("M_average", "M_loc"))] %>%
